# Life And Death Of Coral Reefs

## Synopsis

Charles Birkeland Living coral is a thin veneer, measured in millimeters. Yet this thin film of living tissue has shaped the face of the Earth by creating limestone structures sometimes over 1,300 m thick from the surface down to its base on volcanic rock (Enewetak Atoll), or over 2,000 km long (Great Barrier Reef). About half the world's coastlines are in the tropics and about a third of the tropical coastlines are made of coral reef. Archipelagoes of hundreds of atolls such as the Marshalls, the Maldives, the Tuamotus, and most of the Carolines and Kiribati have been formed by coral. In addition to enlarging high islands (such as the entire northern end of Guam) and extending and protecting coastlines, ancient biogenic reefs have formed even larger areas on the present continents. Shallow living coral reefs are estimated to presently cover over 600,000 km<sup>2</sup> (Smith, 1978). Coral reefs are dynamic systems, producing limestone at the rate of 400-2,000 tons per hectare per year (Chave et al. , 1972). The Great Barrier Reef dominates 2 230,000 km<sup>2</sup> and has grown to this size in a geologically brief period of a few million years. Coral reefs influence the chemical balance of the world's oceans. Roughly half the calcium that enters the sea each year around the world, from the north to south poles, is taken up and temporarily bound into coral reefs (Smith, 1978).

## Customer Reviews

This is a basic and comprehensive book about the processes that affect coral reefs. Excellent edition by Birkeland, includes some of the most respectable scientists in the field. The book includes

plentiful references very useful if you need to start a search in any of the topics included in the book.

This is a good book, a classic for anyone studying the science of coral reefs. All reef scientists need a copy.
