The manual contains every calculation with explanation that you will need to understand water and waste water treatment performance. Chapter 12 on membrane processes is very complete and a very good job explaining membrane technology available and giving the calculations that pertain to membrane performance

Professor Lin's new book is a great job for an environmental engineer to catch water and wastewater technologies. It starts from introducing water resources of Streams and Rivers (Ch1), Lakes and Reservoirs (Ch2), and Groundwater (Ch3) then Fundamental and Treatment Plant Hydraulics (Ch4). Among these chapters, hydrodynamics and hydrology are introduced for one to realize in theoretical aspect. Public Water Supply (Ch5) and Wastewater Engineering (Ch6) are practical examples for engineer to know how to calculate treatment unit function step by step. I appreciate for Lin's efforts and wish each green worker will love it and use it well. By the way, Is Complecated | line 16, p.xi a typo ?

My professional background and experience is related to drinking water treatment so I focused on Chapter 5 of this text. In general I found it to contain an excellent review with examples of fundamental water calculation practices. In particular, the sections relating to aeration and lime softening calculations were very good. The review of the SDWA as an introduction to the Chapter was well done as was the section on CT calculations. With the proliferation of membrane technology across a wide variety of treatment applications, and given the history of membrane performance issues, I would however suggest the future editions give more attention to recommended pretreatment methodology based on specific raw water quality contaminants. That subject is touched on by the author but the reader is left to explore that question himself. Related to membrane wastes (brines), it would also be worthwhile to dedicate more space to residuals disposal as it impacts process selection. At this time, I only skimmed through the remaining sections but the calculation examples appear to be well presented.
